13TH ENISA-EC3 WORKSHOP

- MISP started out as a platform for technical indicator sharing
- The need for a way to describe threat actors, tools and other commonalities became more and more pressing
- **Taxonomies quickly became essential for classifying events**
- The weakness of the tagging approach is that it's not very descriptive
- We needed a way to attach **more complex structures to data**
- Also, with the different naming conventions for the same "thing" attribution was a mess
- This is where the Galaxy concept came in

2024-09-11

## MISP Galaxy

### └─ MISP Galaxies

MISP GALAXIES

- MISP started out as a platform for technical indicator sharing
- The need for a way to describe threat actors, tools and other commonalities became more and more pressing
- **Taxonomies quickly became essential for classifying events**
- The weakness of the tagging approach is that it's not very descriptive
- We needed a way to attach **more complex structures to data**
- Also, with the different naming conventions for the same "thing" attribution was a mess
- This is where the Galaxy concept came in

- Pre-crafted galaxy "clusters" via GitHub project
- Attach them to an event and attribute(s)
- The main design principle was that these higher level informations are meant for human consumption
- This means flexibility - key value pairs, describe them dynamically
- Technical indicators remain strongly typed and validated, galaxies are loose key value lists

- Pre-crafted galaxy "clusters" via GitHub project
- Attach them to an event and attribute(s)
- The main design principle was that these higher level informations are meant for human consumption
- This means flexibility - key value pairs, describe them dynamically
- Technical indicators remain strongly typed and validated, galaxies are loose key value lists

- **Galaxy:** The type of data described (Threat actor, Tool, ...)
- **Cluster:** An individual instance of the galaxy (Sofacy, Turla, ...)
- **Element:** Key value pairs describing the cluster (Country: RU, Synonym: APT28, Fancy Bear)
- **Reference:** Referenced galaxy cluster (Such as a threat actor using a specific tool)

## (SOME) EXISTING GALAXIES

- **Exploit-Kit:** An enumeration of known exploitation kits used by adversaries
- **Microsoft activity group:** Adversary groups as defined by Microsoft
- **Preventive measure:** Potential preventive measures against threats
- **Ransomware:** List of known ransomwares
- **TDS:** Traffic Direction System used by adversaries
- **Threat-Actor:** Known or estimated adversary groups
- **Tool:** Tools used by adversaries (from Malware to common tools)
- **MITRE ATT&CK:** Adversarial Tactics, Techniques, and Common Knowledge (ATT&CK™)

Refs

The Sofacy Group (also known as APT28, Pawn Storm, Fancy Bear and Sednit) is a cyber espionage group believed to have ties to the Russian government. Likely operating since 2007, the group is known to target government, military, and security organizations. It has been characterized as an advanced persistent threat.

## MISP Galaxy

What a cluster looks like

- Internally simply using a taxonomy-like tag to attach them to events
- Example: `misp-galaxy:threat-actor="Sofacy"`
- **Synchronisation works out of the box** with older instances too. They will simply see the tags until they upgrade.
- Currently, as mentioned we rely on the community's contribution of galaxies

## └ Attaching clusters to events

- Internally simply using a taxonomy-like tag to attach them to events
- Example: `misp-galaxy:threat-actor="Sofacy"`
- **Synchronisation works out of the box** with older instances too. They will simply see the tags until they upgrade.
- Currently, as mentioned we rely on the community's contribution of galaxies

MISP Galaxy

└ Attaching clusters

- Creating galaxy clusters has to be straightforward to get the community to contribute
- Building on the prior success of the taxonomies and warninglists
- Simple JSON format in similar fashion
- Just drop the JSON in the proper directory and let MISP ingest it
- We always look forward to contributions to our galaxies repository

### └─ Creating your own galaxy

- Creating galaxy clusters has to be straightforward to get the community to contribute
- Building on the prior success of the taxonomies and warninglists
- Simple JSON format in similar fashion
- Just drop the JSON in the proper directory and let MISP ingest it
- We always look forward to contributions to our galaxies repository
